

HubUnicon Technical Assessment

Company Understanding & Business Questions

1. Why do you want to join HubUnicon?

I want to join HubUnicon because I see an opportunity to work on real-world enterprise software problems while growing as a well-rounded software engineer. The assessment itself reflects areas that interest me, including frontend development, backend architecture, APIs, databases, automation, AI services, and cloud deployment.

I am particularly interested in the way HubUnicon is building solutions around automation and business workflows. I would like to contribute technically, learn from experienced engineers, and understand how scalable SaaS products are designed and delivered for real business requirements.

I also believe HubUnicon would give me an environment where I can take ownership, improve my engineering practices, and continuously develop both my technical and problem-solving skills.

2. What is Hubflow Automation?

Hubflow Automation is an enterprise SaaS platform designed to help businesses manage and automate their day-to-day workflows from a centralized system. It brings together areas such as CRM, contacts, campaigns, meetings, communication, billing, reporting, and automation into a connected platform.

The platform can also use AI and automation services to reduce repetitive manual work, assist users with business tasks, analyze information, and improve decision-making. Integrations such as WhatsApp Business API, background processing, notifications, and analytics can further connect business operations in one ecosystem.

In simple terms, Hubflow Automation aims to help businesses spend less time managing repetitive processes and more time focusing on customers, growth, and business outcomes.

3. Where do you see yourself in the next 2–3 years?

Over the next 2–3 years, I see myself becoming a strong software engineer with solid expertise in backend development, cloud technologies, system architecture, and DevOps practices. I want to move beyond simply implementing features and become someone who understands how complete systems are designed, secured, deployed, monitored, and scaled.

I also want to gain experience working on production-grade SaaS applications, distributed services, databases, APIs, automation, and cloud infrastructure. Along with technical growth, I want to improve my communication, ownership, and ability to solve complex business problems.

My goal is to become an engineer who can take responsibility for a feature or service from development through deployment and continuously improve it based on real-world requirements.

4. Why will customers choose Hubflow over other automation platforms?

Customers are likely to choose Hubflow when it provides more than isolated automation tools and instead gives them a connected platform for managing important business workflows. By combining CRM, communication, campaigns, meetings, billing, reporting, AI-powered assistance, and automation, Hubflow can reduce the need to manage multiple disconnected systems.

Another important advantage can be flexibility. Businesses have different processes and requirements, so a platform that supports integrations, APIs, automation services, analytics, and scalable architecture can adapt as the business grows.

Ultimately, customers will choose Hubflow if it delivers measurable value: less manual work, better visibility into operations, faster communication, improved customer management, and a simpler way to run their workflows. A combination of usability, integration, automation, security, reliability, and continuous innovation can make Hubflow a strong alternative to using several separate platforms.
